

PROJECT DOCUMENTATION

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

ServiceNow – Flow Designer Automation Project

Prepared for Project Submission

Complete 8-Phase Project Documentation

1. Project Overview

This project demonstrates how ServiceNow Flow Designer can automate the procurement process for standard laptop orders. The objective is to reduce manual work, improve consistency, and provide a clear workflow from request submission through completion.

Key goals:

- Automate standard laptop procurement requests.
- Apply conditions and approvals consistently.
- Create and update required records automatically.
- Notify relevant users at important stages.
- Track the request from initiation to completion.

2. Phase 1 – Requirement Analysis

Identify the business requirement for a standard laptop ordering process. The process should accept a laptop request, validate the request, route it for approval when required, and continue the procurement process automatically.

Inputs: Employee/requester information, laptop requirement, quantity, justification and other required request details.

Expected result: A valid request enters an automated procurement workflow.

3. Phase 2 – ServiceNow Setup

Prepare the ServiceNow environment for the automation. Create or identify the required tables, fields, users/roles, catalog/request components and Flow Designer resources.

Typical setup tasks:

- Open the ServiceNow instance.
- Verify the required application/module access.
- Create or configure the request data fields.
- Ensure appropriate users and approval roles are available.
- Confirm Flow Designer access.

4. Phase 3 – Request Configuration

Configure the standard laptop request so that the requester can provide the information needed for procurement. The request should clearly identify the requested item and contain enough information for automated processing.

Example request data: Requester, department, laptop type, quantity, business justification and delivery information.

5. Phase 4 – Flow Designer Creation

Create the automation in Flow Designer. The flow begins with a suitable trigger, such as creation or submission of a laptop request.

Flow structure:

Trigger → Validate Request → Check Conditions → Approval (if required) → Create/Update Procurement Records → Notifications → Complete Request

Flow Designer actions and conditions should be configured so that each stage executes automatically and the request moves to the next stage only when its requirements are satisfied.

6. Phase 5 – Approval and Procurement Automation

Configure approval logic for requests that require authorization. After approval, the flow can create or update the appropriate procurement-related records and assign work to the responsible team.

Automation can include:

- Approval request generation.
- Assignment to the procurement/IT team.
- Record creation or status updates.
- Automatic notifications to requester and fulfiller.
- Handling of approved and rejected paths.

7. Phase 6 – Testing and Validation

Test the flow with different request scenarios to confirm that the automation behaves correctly. Validate the trigger, conditions, actions, approvals, notifications and final status.

Test Scenario	Expected Result
Standard laptop request submitted	Flow starts successfully
Valid request	Request proceeds to the next stage
Approval required	Approval is generated
Approved request	Procurement process continues
Rejected request	Request follows rejection path
Flow completion	Final status/notification is updated

8. Phase 7 – Demo and Documentation

Record a project demonstration showing the configured ServiceNow process. The demo should show the request being submitted, the Flow Designer execution, approval/automation steps, record updates and the final result.

Recommended demo sequence:

1. Open the ServiceNow application.
2. Show the standard laptop request configuration.
3. Submit a sample request.
4. Open Flow Designer and show the flow structure.

5. Demonstrate approval/automation behavior.
6. Show the resulting records and notifications.
7. Show successful completion.

Screenshot placeholders for final submission:

- Screenshot 1 – Request configuration
- Screenshot 2 – Flow trigger
- Screenshot 3 – Flow actions/conditions
- Screenshot 4 – Approval step
- Screenshot 5 – Test execution/result
- Screenshot 6 – Final completed request

9. Phase 8 – Final Review and Submission

Review the complete implementation and confirm that the standard laptop ordering process works from start to finish. Ensure the project documentation, screenshots and demo video are organized before submission.

Final checklist:

- All 8 phases documented
- Flow Designer configuration completed
- Test scenarios completed
- Screenshots captured
- Demo video recorded
- Project files organized
- Documentation converted to PDF
- Final files ready for GitHub/submission

10. Project Outcome

The completed solution provides a structured and automated approach to standard laptop procurement using ServiceNow Flow Designer. By replacing repetitive manual steps with a defined workflow, the process becomes easier to track, more consistent, and simpler to demonstrate and maintain.

11. Conclusion

This project demonstrates the practical use of ServiceNow Flow Designer to automate an IT procurement scenario. The eight phases cover requirement analysis, setup, request configuration, flow creation, approval and procurement automation, testing, demonstration/documentation, and final submission. The resulting workflow provides a clear end-to-end automation model for standard laptop orders.
